Absence of envy in economies with non- negligible agents

*Sala Riunioni - Aula
Domenico Candeloro ore
12:00*

Sunto:

We investigate the envy-freeness property of Walrasian allocations at the presence of non-negligible agents. We provide two sufficient conditions under which a redistribution of resources is efficient and strictly envy-free if and only if it results from a competitive mechanism. Moreover we suggest a concept of relationship among people and we obstruct envy only among related individuals. We identify conditions under which equilibria are characterized by imposing efficiency and absence of envy just among *linked* people.
